Gradient Descent

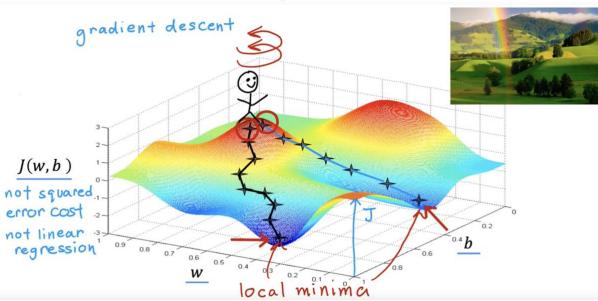

Have some function
$$J(w,b)$$
 for linear regression or any function
$$\min_{w,b} J(w,b) = \min_{w_1, \dots, w_n, b} J(w_1, w_2, \dots, w_n, b)$$

Outline:

Start with some w, b (set w=0, b=0)

Keep changing w, b to reduce J(w, b)Until we settle at or near a minimum J not always

may have >1 minimum

For each and every step, you will look around at 360 degree and decides to go in which direction.

Implementing gradient descent

(d, w) T w.b)

→ After looking around for 360 degree, Which direction to go ??

ightarrow How many steps you would take in that particular direction $\ref{fig:prop}$?

Learning rate
Derivative

→ Steps take in a particular direction

Gradient descent algorithm

Repeat until convergence

Learning rate Derivative
$$b = b - \alpha J_b J(w,b)$$

$$b = b - \alpha J_b J(w,b)$$
Simultaneously update w and b

Learning rate Derivative

Assignment | Truth assertion a=c a=a+1 X Code Math a==c

Correct: Simultaneous update

$$tmp_{w} = w - \alpha \frac{\partial}{\partial w} J(w, b)$$

$$tmp_{b} = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

$$w = tmp_{w}$$

$$b = tmp_{b}$$

temp b takes the old w value

Incorrect

$$\overline{tmp_w = w - \alpha \frac{\partial}{\partial w} J(w, b)}$$

$$\underbrace{tmp_b}_{b} = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

$$\underline{b} = tmp_b$$

temp b takes the updated w value

Question

Gradient descent is an algorithm for finding values of parameters w and b that minimize the cost function J. What does this update statement do? (Assume lpha is small.)

$$w = w - \alpha \frac{\partial J(w,b)}{\partial w}$$

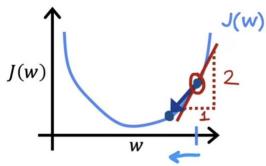

- lacksquare Updates parameter w by a small amount
- \bigcirc Checks whether w is equal to $w \alpha \frac{\partial J(w,b)}{\partial w}$

Correct

This updates the parameter by a small amount, in order to reduce the cost J.

Gradient Descent Intuition

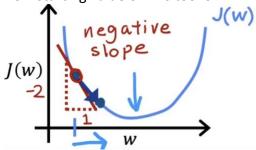

Now starting value of w is too high. Will get a positive slope. So w is reducing.

$$w = w - \propto \frac{\frac{d}{dw} J(w)}{>0}$$

 $w = w - \underline{\alpha \cdot} (positive \ number)$

Now starting value of w is too low. Will get a negative slope. So w is increasing.

$$\frac{d}{dw}J(w)$$
 <0

 $w = \underbrace{w - \alpha \cdot (negative \ number)}_{\bigwedge}$

Question

Assume the learning rate α is a small positive number. When $\frac{\partial J(w,b)}{\partial w}$ is a positive number (greater than zero) -- as in the example in the upper part of the slide shown above -- what happens to w after one update step?

- $\bigcirc w$ increases
- \bigcirc It is not possible to tell if w will increase or decrease.
- \bigcirc w stays the same
- \bigcirc w decreases.

✓ Correct

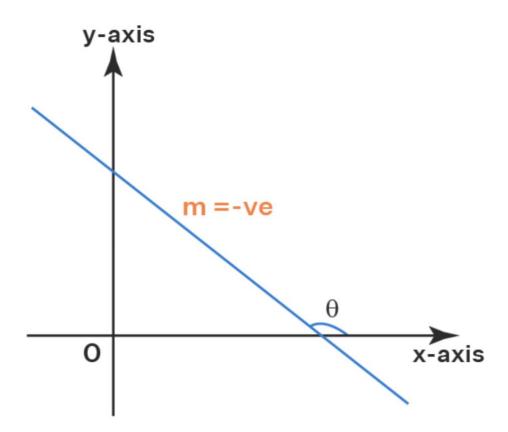

The learning rate α is always a positive number, so if you take W minus a positive number, you end up with a new value for W that is smaller

Graph of Negative Slope

The concept of the negative slope gives an inverse relationship between two quantities. The two quantities are represented graphically across the x-axis and the y-axis, and the line is plotted to represent the relationship between these two variables. As the value of the quantity represented along with the x-axis increases, the value of the other quantity represented along with the y-axis decreases. The inverse relationship of the increase of the x value, and the decrease of the y value is represented by the negative slope of the line.

Negative Slope Of a Line

A negative slope graph is a line with a negative slope, which falls as it moves from left to right. The line with a negative slope makes an obtuse angle with the positive x-axis, in the anti-clockwise direction.

Learning Rate

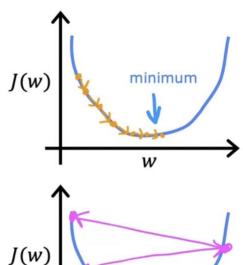

$$w = w - \bigcirc \frac{d}{dw} J(w)$$

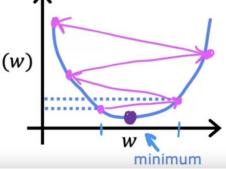

If α is too small... Gradient descent may be slow.

If α is too large...

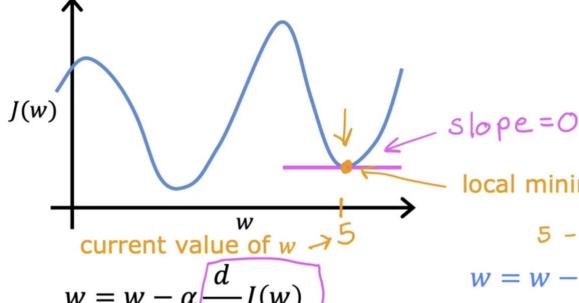

Gradient descent may:

- Overshoot, never reach minimum
- Fail to converge, diverge

When the w is already at the local minimum ??

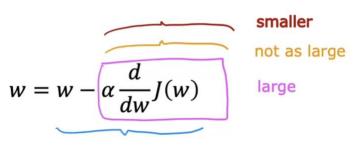

local minimum

$$w = w - \alpha \cdot \mathbf{0}$$

$$w = w$$

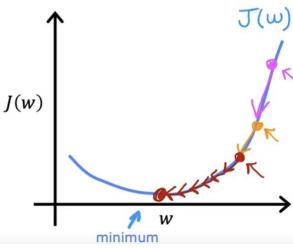

Can reach local minimum with fixed learning rate

Near a local minimum,

- Derivative becomes smaller
- Update steps become smaller

Can reach minimum without decreasing learning rate ✓

pink \rightarrow slope is large, So derivative is also large, So large step. orange \rightarrow slope is small, So derivative is also small, So small step. Red \rightarrow slope is too small, So derivative is also too small, So too small step.

So as we approach the minimum. The derivative gets closer and closer to zero. So as we run gradient descent, eventually we're taking very small steps until you finally reach a local minimum.

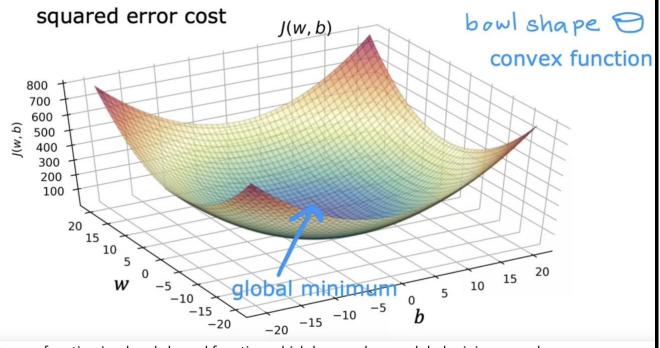

Gradient Descent for Linear Regression

$$\frac{\partial}{\partial w} J(w,b) = \frac{1}{J_{w}} \sum_{i=1}^{m} \left(f_{w,b}(x^{(i)}) - y^{(i)} \right)^{2} = \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right)^{2} \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(f_{w,b}(x^{(i)}) - y^{(i)} \right) x^{(i)} \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(f_{w,b}(x^{(i)}) - y^{(i)} \right)^{2} = \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right)^{2} \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} - y^{(i)} \right)^{2} \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(f_{w,b}(x^{(i)}) - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(f_{w,b}(x^{(i)}) - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{w}} \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \sum_{i=1}^{m} \left(wx^{(i)} + b - y^{(i)} \right) \\
= \frac{1}{J_{$$

Gradient descent algorithm

repeat until convergence {
$$w = w - \alpha \frac{1}{m} \sum_{i=1}^{m} (f_{w,b}(x^{(i)}) - y^{(i)}) \quad x^{(i)}$$
 Update
$$b = b - \alpha \frac{1}{m} \sum_{i=1}^{m} (f_{w,b}(x^{(i)}) - y^{(i)})$$
 Simultaneously
$$f_{w,b}(x^{(i)}) = w x^{(i)} + b$$

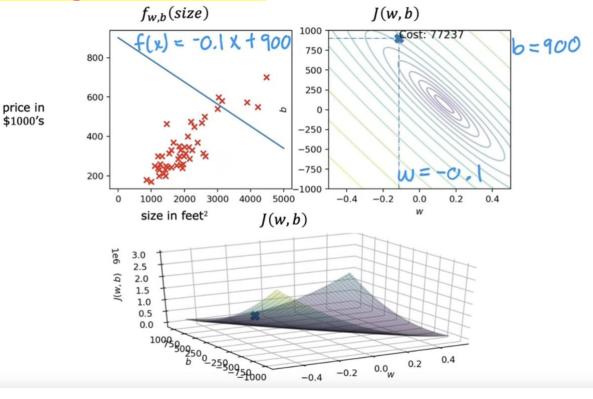

When using square errored cost function

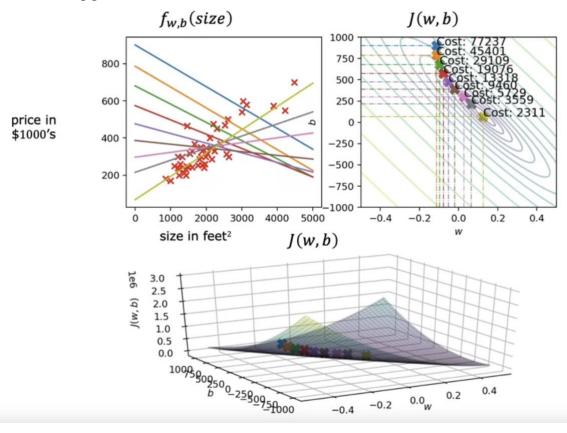

Convex function is a bowl shaped function which have only one global minimum and no local minimum it-self.

When you implement gradient descent on a convex function, one nice property is that so long as you're learning rate is chosen appropriately, it will always converge to the global minimum.

Running Gradient Descent

After running gradient descent,

"Batch" gradient descent

"Batch": Each step of gradient descent uses all the training examples.

other gradient descent: subsets

x size in feet²	y price in \$1000's	$\sum_{m=47}^{m=47} \sum_{w,b}^{m} (f_{w,b}(x^{(i)}) - y^{(i)})^{2}$

Quiz

1/1 point

Gradient descent is an algorithm for finding values of parameters w and b that minimize the cost function J.

repeat until convergence {

$$w = w - \alpha \frac{\partial}{\partial w} J(w, b)$$
$$b = b - \alpha \frac{\partial}{\partial b} J(w, b)$$

When $\frac{\partial J(w,b)}{\partial w}$ is a negative number (less than zero), what happens to w after one update step?

- $\bigcirc w$ stays the same
- left w increases
- igcirc It is not possible to tell if w will increase or decrease.
- $\bigcirc \ w \ {\it decreases}$
- The learning rate is always a positive number, so if you take W minus a negative number, you end up with a new value for W that is larger (more positive)

1/1 point

For linear regression, what is the update step for parameter b?

$$igcircle b = b - lpha rac{1}{m} \sum_{i=1}^m (f_{w,b}(x^{(i)}) - y^{(i)}) x^{(i)}$$

$$igodel{eq:b} egin{aligned} igodel{b} b = b - lpha rac{1}{m} \sum\limits_{i=1}^{m} (f_{w,b}(x^{(i)}) - y^{(i)}) \end{aligned}$$

 \bigcirc Correct The update step is $b=b-lpharac{\partial J(w,b)}{\partial w}$ where $rac{\partial J(w,b)}{\partial b}$ can be computed with this expression: $\sum\limits_{i=0}^{m}(f_{w,b}(x^{(i)})-y^{(i)})$
